## Honour School of Mathematics and Statistics Syllabus and Synopses for Part C 2022–2023 for examination in 2023

### Contents

1	Honour School of Mathematics and Statistics	2
1.1	Units	2
1.2	Part C courses in future years	2
1.3	Course list by term	3
2	Statistics units	4
2.1	SC1 Stochastic Models in Mathematical Genetics – 16 MT	4
2.2	SC2 Probability and Statistics for Network Analysis – 16 MT	5
2.3	SC4 Advanced Topics in Statistical Machine Learning – 16 HT	6
2.4	SC5 Advanced Simulation Methods - 16 HT	7
2.5	SC7 Bayes Methods – 16 HT	8
2.6	SC8 Topics in Computational Biology – 16 HT	9
2.7	SC9 Probability on Graphs and Lattices – 16 MT	11
2.8	SC10 Algorithmic Foundations of Learning – 16 MT	11
2.9	C8.4: Probabilistic Combinatorics - 16 HT	13
3	Mathematics units	15

*SC6 Graphical Models isn't being offered this year.*

Every effort is made to ensure that the list of courses offered is accurate at the time of going online. However, students are advised to check the up-to-date version of this document on the Department of Statistics website.

Notice of misprints or errors of any kind, and suggestions for improvements in this booklet should be addressed to the Academic Administrator in the Department of Statistics, [academic.administrator@stats.ox.ac.uk](mailto:academic.administrator@stats.ox.ac.uk).

Updated October 2022

Version 1.1 has small corrections to SC9 Probability on Graphs and Lattices

# 1 Honour School of Mathematics and Statistics

## 1.1 Units

See the current edition of the Examination Regulations at <https://examregs.admin.ox.ac.uk> for the full regulations governing these examinations. The examination conventions can be found at [https://canvas.ox.ac.uk/courses/167098/modules#module\\_306703](https://canvas.ox.ac.uk/courses/167098/modules#module_306703)

In Part C,

- each candidate shall offer a minimum of six units and a maximum of eight units from the schedule of units for Part C
- and each candidate shall also offer **a dissertation** on a statistics project (equivalent of 2 units).
- At least 3 of the units taken by Part C students must be assessed by written examination.

At least **two** units should be from the schedule of 'Statistics' units. The USMs for the dissertation and the best six units will count for the final classification.

Units from the schedule of 'Mathematics Department units' for Part C of the Honour School of Mathematics are also available – see Section 3.

This booklet describes the units available in Part C. Information about dissertations/ statistics projects will be available on the Department of Statistics Canvas site at [Mathematics and Statistics Part C](#)

All of the units described in this booklet are "M-level".

Students are asked to register for the options they intend to take by the end of week 10, Trinity Term 2022 using the Mathematical Institute course management portal. <https://courses.maths.ox.ac.uk/course/index.php?categoryid=106>. Students may alter the options they have registered for after this but it is helpful if their registration is as accurate as possible. Students will then be asked to sign up for classes at the start of Michaelmas Term 2022. Students who register for a course or courses for which there is a quota should consider registering for an additional course (by way of a "reserve choice") in case they do not receive a place on the course with the quota.

Every effort will be made when timetabling lectures to ensure that mathematics lectures do not clash. However, because of the large number of options this may sometimes be unavoidable.

## 1.2 Part C courses in future years

In any year, most courses available in Part C that year will normally also be available in Part C the following year. However, sometimes new options will be added or existing options may cease to run. The list of courses that will be available in Part C in any year will be published by the end of the preceding Trinity Term.

### 1.3 **Course list by term**

The 2022-2023 list of Part C courses by term is:

#### **Michaelmas Term**

SC1 Stochastic Models in Mathematical Genetics  
SC2 Probability and Statistics for Network Analysis  
SC9 Probability on Graphs and Lattices  
SC10 Algorithmic Foundations of Learning

#### **Hilary Term**

SC4 Advanced Topics in Statistical Machine Learning  
SC5 Advanced Simulation Methods  
SC7 Bayes Methods  
SC8 Topics in Computational Biology  
C8.4 Probabilistic Combinatorics.

## 2. Statistics Units

### 2.1 SC1 Stochastic Models in Mathematical Genetics – 16 MT

Level: M-level

Method of Assessment: written examination

Weight: Unit

#### *Recommended Prerequisites*

Part A A8 Probability.

SB3.1 Applied Probability would be helpful.

#### *Aims & Objectives*

The aim of the lectures is to introduce modern stochastic models in mathematical population genetics and give examples of real world applications of these models. Stochastic and graph theoretic properties of coalescent and genealogical trees are studied in the first eight lectures. Diffusion processes and extensions to model additional key biological phenomena are studied in the second eight lectures.

#### *Synopsis*

Evolutionary models in Mathematical Genetics:

The Wright-Fisher model. The Genealogical Markov chain describing the number ancestors back in time of a collection of DNA sequences.

The Coalescent process describing the stochastic behaviour of the ancestral tree of a collection of DNA sequences. Mutations on ancestral lineages in a coalescent tree. Models with a variable population size.

The frequency spectrum and age of a mutation. Ewens' sampling formula for the probability distribution of the allele configuration of DNA sequences in a sample in the infinitely-many-alleles model. Hoppe's urn model for the infinitely-many-alleles model.

The infinitely-many-sites model of mutations on DNA sequences. Gene trees as perfect phylogenies describing the mutation history of a sample of DNA sequences. Graph theoretic constructions and characterizations of gene trees from DNA sequence variation. Gusfield's construction algorithm of a tree from DNA sequences. Examples of gene trees from data.

Modelling biological forces in Population Genetics: Recombination. The effect of recombination on genealogies. Detecting recombination events under the infinitely-many-sites model. Hudson's algorithm. Haplotype bounds on recombination events. Modelling recombination in the Wright-Fisher model. The coalescent process with recombination: the ancestral recombination graph. Properties of the ancestral recombination graph.

Introduction to diffusion theory. Tracking mutations forward in time in the Wright-Fisher model. Modelling the frequency of a neutral mutation in the population via a diffusion process limit. The generator of a diffusion process with two allelic types. The probability of fixation of a mutation. Genic selection. Extension of results from neutral to selection case. Behaviour of selected mutations.

### *Reading*

S. Tavaré and O. Zeitouni, *Lectures on Probability Theory and Statistics, Ecole d'Eté de Probabilités de Saint-Flour XXXI - 2001*, Lecture Notes in Mathematics 1837, Springer, 2004

## **2.2 SC2 Probability and Statistics for Network Analysis – 16 MT**

Level: M-level

Method of Assessment: Written examination

Weight: Unit

For this course, 2 lectures and 2 intercollegiate classes are replaced by 2 practical classes. (The total time for this course is the same as for other Part C courses.)

### *Recommended prerequisites*

Part A A8 Probability and A9 Statistics

### *Aims and Objectives*

Many data come in the form of networks, for example friendship data and protein-protein interaction data. As the data usually cannot be modelled using simple independence assumptions, their statistical analysis provides many challenges. The course will give an introduction to the main problems and the main statistical techniques used in this field. The techniques are applicable to a wide range of complex problems. The statistical analysis benefits from insights which stem from probabilistic modelling, and the course will combine both aspects.

### *Synopsis*

Exploratory analysis of networks. The need for network summaries. Degree distribution, clustering coefficient, shortest path length. Motifs.

Probabilistic models: Bernoulli random graphs, geometric random graphs, preferential attachment models, small world networks, inhomogeneous random graphs, exponential random graphs.

Small subgraphs: Stein's method for normal and Poisson approximation. Branching process approximations, threshold behaviour, shortest path between two vertices.

Statistical analysis of networks: Sampling from networks. Parameter estimation for models. Inferring edges in networks. Network comparison. A brief look at community detection.

### *Reading*

R. Durrett, *Random Graph Dynamics*, Cambridge University Press, 2007

E.D Kolaczyk and G. Csádi, *Statistical Analysis of Network Data with R*, Springer, 2014  
M. Newman, *Networks: An Introduction*. Oxford University Press, 2010

### 2.3 SC4 Advanced Topics in Statistical Machine Learning – 16 HT

Level: M-level

Methods of Assessment: written examination.

Weight: Unit

#### *Recommended prerequisites*

The course requires a good level of mathematical maturity. Students are expected to be familiar with core concepts in statistics (regression models, bias-variance tradeoff, Bayesian inference), probability (multivariate distributions, conditioning) and linear algebra (matrix-vector operations, eigenvalues and eigenvectors). Previous exposure to machine learning (empirical risk minimisation, dimensionality reduction, overfitting, regularisation) is highly recommended.

Students would also benefit from being familiar with the material covered in the following courses offered in the Statistics department: SB2.1 (formerly SB2a) Foundations of Statistical Inference and in SB2.2 (formerly SB2b) Statistical Machine Learning.

#### *Aims and Objectives*

Machine learning is widely used across the sciences, engineering and society, to construct methods for identifying interesting patterns and predicting accurately from large datasets.

This course introduces several widely used machine learning techniques and describes their underpinning statistical principles and properties. The course studies both unsupervised and supervised learning and several advanced and state-of-the-art topics are covered in detail. The course will also cover computational considerations of machine learning algorithms and how they can scale to large datasets.

#### *Synopsis*

Empirical risk minimisation. Loss functions. Generalization. Over- and underfitting. Regularisation.

Support vector machines.

Kernel methods and reproducing kernel Hilbert spaces. Representer theorem. Representation of probabilities in RKHS.

Deep learning: Neural networks. Computation graphs. Automatic differentiation. Stochastic gradient descent.

Probabilistic and Bayesian machine learning: Fundamentals of the Bayesian approach.

Variational inference. Latent variable models.

Deep generative models. Variational auto-encoders.

Gaussian processes. Bayesian optimisation.

### *Software*

Knowledge of Python is not required for this course, but some examples may be done in Python. Students interested in learning Python are referred to the following free University IT online course, which should ideally be taken before the beginning of this course: <https://skills.it.ox.ac.uk/whats-on#/course/LY046>

### *Reading*

C. Bishop, Pattern Recognition and Machine Learning, Springer, 2007  
K. Murphy, Machine Learning: a Probabilistic Perspective, MIT Press, 2012

### *Further Reading*

T. Hastie, R. Tibshirani, J. Friedman, Elements of Statistical Learning, Springer, 2009  
Scikit-learn: Machine Learning in Python, Pedregosa et al., JMLR 12, pp. 2825-2830, 2011, <http://scikit-learn.org/stable/tutorial/>

## 2.4 **SC5 Advanced Simulation Methods** - 16 HT

Level: M-level

Methods of Assessment: This course is assessed by written examination.

Weight: Unit

### *Recommended Prerequisites*

The course requires a good level of mathematical maturity as well as some statistical intuition and background knowledge to motivate the course. Students are expected to be familiar with core concepts from probability (conditional probability, conditional densities, properties of conditional expectations, basic inequalities such as Markov's, Chebyshev's and Cauchy-Schwarz's, modes of convergence), basic limit theorems from probability in particular the strong law of large numbers and the central limit theorem, Markov chains, aperiodicity, irreducibility, stationary distributions, reversibility and convergence. Most of these concepts are covered in courses offered in the Statistics department, in particular prelims probability, A8 probability and SB3.1 (formerly SB3a) Applied Probability.

Familiarity with basic Monte Carlo methods will be helpful, as for example covered in A12 Simulation and Statistical Programming.

Some familiarity with concepts from Bayesian inference such as posterior distributions will be useful in order to understand the motivation behind the material of the course.

### *Aims and Objectives*

The aim of the lectures is to introduce modern simulation methods.

This course concentrates on Markov chain Monte Carlo (MCMC) methods and Sequential Monte Carlo (SMC) methods. Examples of applications of these methods to complex inference problems will be given.

### **Synopsis**

Classical methods: inversion, rejection, composition.

Importance sampling.

MCMC methods: elements of discrete-time general state-space Markov chains theory, Metropolis-Hastings algorithm.

Advanced MCMC methods: Gibbs sampling, slice sampling, tempering/annealing, Hamiltonian (or Hybrid) Monte Carlo, pseudo-marginal MCMC.

Sequential importance sampling.

SMC methods: nonlinear filtering.

*Reading*

C.P. Robert and G. Casella, *Monte Carlo Statistical Methods*, 2<sup>nd</sup> edition, Springer-Verlag, 2004

*Further reading*

J.S. Liu, *Monte Carlo Strategies in Scientific Computing*, Springer-Verlag, 2001

## 2.5 **SC7 Bayes Methods** – 16 HT

Level: M-level

Method of Assessment: Written examination

Weight: Unit

*Recommended prerequisites*

SB2.1 (formerly SB2a) Foundations of Statistical Inference is desirable, of which 6 lectures on Bayesian inference, decision theory and hypothesis testing with loss functions are assumed knowledge. A12 Simulation and Statistical Programming desirable.

*Synopsis*

Theory: Decision-theoretic foundations, Savage axioms. Prior elicitation, exchangeability. Bayesian Non-Parametric (BNP) methods, the Dirichlet process and the Chinese Restaurant Process. Asymptotics, and information criteria.

Computational methods: Bayesian inference via MCMC; Estimation of marginal likelihood; Approximate Bayesian Computation and intractable likelihoods; reversible jump MCMC.

Case Studies: extend understanding of prior elicitation, BNP methods and asymptotics through a small number of substantial examples. Examples to further illustrate building statistical models, model choice, model averaging and model assessment, and the use of Monte Carlo methods for inference.

*Reading*

C.P. Robert, *The Bayesian Choice: From Decision-Theoretic Foundations to Computational Implementation*, 2<sup>nd</sup> edition, Springer, 2001

*Further Reading*

A. Gelman et al, *Bayesian Data Analysis*, 3<sup>rd</sup> edition, Boca Raton Florida: CRC Press, 2014

P Hoff, *A First Course in Bayesian Statistical Methods*, Springer, 2010

DeGroot, Morris H., *Optimal Statistical Decisions*. Wiley Classics Library. 2004.

## 2.7 SC8 Topics in Computational Biology – 16 HT

Level: M-level

Method of Assessment: Mini-project

Weight: Unit

### *Recommended Prerequisites:*

The lectures attempt to be self-contained but clearly knowledge algorithms, combinatorics and probability theory (A8 Probability and SB3.1 Applied Probability) would be a help. The course requires a good level of mathematical maturity.

### *Aims & Objectives*

Modern molecular biology generates large amounts of data, such as sequences, structures and expression data, that needs different forms of statistical analysis and modelling to be properly interpreted. This course focuses on four topics within this vast area: Molecular Dynamics, Molecule Enumeration, Comparative Biology and Overview of Computational Biology and Computational Neurosciences.

### *Synopsis:*

**Computational Models of Pattern and Shape** - Classically, Multicellular Organisms were identified by their Patterns and Shapes. This has over the last 1-2 centuries been vastly enhanced by molecular/cellular characterisations. This has been a triumph of modern science. The dynamics and evolution of molecular/cellular components and processes has well-developed models associated, but as you proceed to higher levels within an individual, such as tissue and organs and eventually the complete organism, very major challenges remain. Within this sub-topic we will try to survey the main Patterns/Shapes observed in Multicellular Organisms, the models that have been used to describe and explain them. Finally, we will discuss attempts to go from Genome to Patterns/Shapes. This subtopic will be one of the main challenges for the biosciences in the coming decades.

**Machine Learning in the Biosciences** - Machine Learning [ML] and Deep Learning [DL] have proved very powerful in the Biosciences. ML/DL is now a vast topic with a lot of architectures [recurrent, convolutional, autoencoder, generative adversarial networks (GANs),...] designed to model different problems. There are a large set of learning algorithm making these architectures fit/analyse large data sets. Deep Learning methods is getting a lot of attention with the latest success prediction of protein structure but has also proven useful in other areas of structural biology, such as prediction of physical contacts and function, as well as RNA analysis. Other success areas are ChemInformatics and Genomics. In ChemInformatics, Graph Convolutional Networks have been especially useful and the problems of key interest include property prediction of small molecules [annotation of chemical space], reactions and catalysis. In Genomics prediction of expression levels, phenotypes associated a genome and annotation of genomes are recent success areas for ML/DL.

**Computational Virology** - Viruses are fascinating biological entities and there is a huge interest in them and much of the research is turning Computational. We will give an overview of viruses - the genomes, structure, classification and mode of reproduction. Models of virus spread from very basic models without spatial structure to more complicated models will be presented. Molecular evolution of viruses spans from years to possibly millennia; in principle to 3 billion years but viral evolution is so fast that

inference of their evolution can only go a fraction of that back in time. Evolutionary studies sheds light on rate, functional constraints and appearance of malignancy. Evolution within an individual illuminates the tug of war between immune system and the virus. This topic was introduced in 2021 and proved a prescient choice. This was taken as an opportunity and SARS-CoV-2/COVID-19 was taken as a case study in these lectures and the associate Class Discussions.

**Modelling the Biosphere** - The biosphere is a well-defined physical system that can be described at different levels of coarse-grained. At the most detailed level, it is an extremely complicated system with an energy in- and outflux, a physical system consisting of atmosphere, ocean and crust and in excess of 10 million species. But even at the very coarsest level major insights can be obtained and the greenhouse effect was pretty precisely described 130 years based on the simplest of models. Climate Change and Weather Forecasting make models of immense economic importance and are experience major development, both in terms of data collection, parameterisation and computational power. Like in epidemics, forecasting and assessment of forecasting is important. Statistical testing and causal

The exact plan for lectures is:

W1 The Classical Models of Patterns and Shapes  
W1 Patterns and Shapes in Animals  
W2 Patterns and Shapes in Plants  
W2 Functions from Genome to Pattern and Shape  
W3 Basics of Machine and Deep Learning  
W3 Applications in Structural Biology  
W4 Applications in Cheminformatics  
W4 Applications in Genomics  
W5 The Basics of Virology and Epidemics  
W5 Molecular Evolution of Viruses  
W6 Spread of Viral Epidemics  
W6 Intra-Host Evolution of Viruses  
W7 The Basics of the Biosphere  
W7 Modelling the Dynamics of the Biosphere  
W8 Short- and Long- Term Forecasting of the Biosphere  
W8 Climate Change

*Reading:*

The teaching material from 2021 would be useful to browse, but the 2022 course has some changes in syllabus and improvements:

## 2.8 SC9 Probability on Graphs and Lattices – 16 MT

Level: M-level

Method of Assessment: Written examination Weight: Unit

### *Recommended Prerequisites*

Discrete and continuous time Markov processes on countable state space, as covered for example in Part A A8 Probability and Part B SB3.1 Applied Probability.

### *Aims and Objectives*

The aim is to introduce fundamental probabilistic and combinatorial tools, as well as key models, in the theory of discrete disordered systems. We will examine the large-scale behaviour of systems containing many interacting components, subject to some random noise. Models of this type have a wealth of applications in statistical physics, biology and beyond, and we will see several key examples in the course. Many of the tools we will discuss are also of independent theoretical interest, and have far reaching applications. For example, we will study the amount of time it takes for a random system to reach its stationary distribution (mixing time). This concept is also important in many statistical applications, such as studying the run time of MCMC methods.

### *Synopsis*

- Uniform spanning trees, loop-erased random walks, Wilson's algorithm, the Aldous-Broder algorithm.
- Percolation, phase transitions in  $Z^d$ , specific tools in  $Z^2$ .
- Ising model, random-cluster model and other models from statistical mechanics (e.g. Potts model, hard-core model).
- Glauber dynamics, mixing times, couplings.

## 2.9 SC10 Algorithmic Foundations of Learning – 16 MT

Level: M-level

Method of Assessment: Written examination

Weight: Unit

### *Recommended Prerequisites*

The course requires a good level of mathematical maturity. Students are expected to have working knowledge of core concepts in probability theory (basic properties of probabilities, such as union bounds, and of conditional expectations, such as the tower property or law of total expectations; basic inequalities, such as Markov's and Jensen's), statistics (confidence intervals, hypothesis testing), and linear algebra (matrix-vector operations, eigenvalues and eigenvectors; basic inequalities, such as Cauchy-Schwarz's and Hölder's). Previous exposure to machine learning (empirical risk minimisation, overfitting, regularisation) is recommended.

Students would benefit from being familiar with the material covered in SB2.1 (formerly SB2a) Foundations of Statistical Inference (in particular, Decision Theory) and in SB2.2 (formerly SB2b) Statistical Machine Learning.

### *Aims and objectives*

The course is meant to provide a rigorous theoretical account of the main ideas underlying machine learning, and to offer a principled framework to understand the algorithmic paradigms being used, along with non-asymptotic methods for the study of random structures in high-dimensional probability, statistics, and optimisation.

### *Synopsis*

- Statistical learning frameworks for prediction, estimation and online learning.
- Probability:
  - Maximal inequalities.
  - Rademacher and Gaussian complexities.
  - Elements of VC theory.
  - Covering and packing numbers.
  - Chaining.
  - Concentration inequalities.
- Statistics:
  - Bayes decision rules.
  - Empirical risk minimisation. Error decomposition: generalisation, optimisation, and approximation.
  - Learning via uniform convergence, margin bounds, and algorithmic stability.
  - Regularisation: explicit (constraints and penalisation) and implicit (algorithmic).
  - Convex loss surrogates.
  - Slow and fast rates.
  - Minimax lower bounds and hypothesis testing.
- Optimisation:
  - Elements of convex theory.
  - Oracle model. Gradient descent. Mirror descent.
  - Stochastic oracle model. Stochastic gradient descent. Stochastic mirror descent. Variance reduction techniques.
  - Implicit Bias.
  - Online optimisation.
- Examples
  - Linear predictors, including Boosting.
  - Non-linear predictors, including Support Vector Machines and Neural Networks.

- High-dimensional estimators for sparse and low-rank problems, including Lasso.
- Online learning, including multi-armed bandit problems, reinforcement learning and algorithms.

## 2.95 **C8.4 Probabilistic Combinatorics** - 16 HT

Level: M-level

Method of Assessment: Written examination.

Weight: Unit

### *Recommended Prerequisites:*

B8.5 Graph Theory and A8: Probability. C8.3 Combinatorics is not as essential prerequisite for this course, though it is a natural companion for it.

### *Overview*

Probabilistic combinatorics is a very active field of mathematics, with connections to other areas such as computer science and statistical physics. Probabilistic methods are essential for the study of random discrete structures and for the analysis of algorithms, but they can also provide a powerful and beautiful approach for answering deterministic questions. The aim of this course is to introduce some fundamental probabilistic tools and present a few applications.

### *Learning Outcomes*

The student will have developed an appreciation of probabilistic methods in discrete mathematics.

### *Synopsis*

First-moment method, with applications to Ramsey numbers, and to graphs of high girth and high chromatic number.

Second-moment method, threshold functions for random graphs.

Lovász Local Lemma, with applications to two-colourings of hypergraphs, and to Ramsey numbers.

Chernoff bounds, concentration of measure, Janson's inequality.

Branching processes and the phase transition in random graphs.

Clique and chromatic numbers of random graphs.

### 3 Mathematics units

The Mathematics units that students may take are drawn from Part C of the Honour School of Mathematics. For full details of these units, see the Syllabus and Synopses for Part C of the Honour School of Mathematics, which are available on the web at <https://courses.maths.ox.ac.uk/course/index.php?categoryid=8>

The Mathematics units that are available are as follows:

C1.1: Model Theory	16 MT
C1.2: Godel's Incompleteness Theorems	16 HT
C1.3: Analytic Topology	16 MT
C1.4: Axiomatic Set Theory	16 HT
C2.1: Lie Algebras	16 MT
C2.2: Homological Algebra	16 MT
C2.3: Representation Theory of Semisimple Lie Algebras	16 HT
C2.4: Infinite Groups	16 MT
C2.5: Non-Commutative Rings	16 HT
C2.6: Introduction to Schemes	16 HT
C2.7: Category Theory	16 MT
C3.1: Algebraic Topology	16 MT
C3.2: Geometric Group Theory	16 HT
C3.3: Differentiable Manifolds	16 MT
C3.4: Algebraic Geometry	16 MT
C3.5: Lie Groups	16 HT
C3.7: Elliptic Curves	16 HT
C3.8: Analytic Number Theory	16 HT
C3.9: Computational Algebraic Topology	16 HT
C3.10: Additive Combinatorics	16 MT
C3.11: Riemannian Geometry	16 HT
C3.12: Low-Dimensional Topology and Knot Theory	16 HT
C4.1: Further Functional Analysis	16 MT
C4.3: Functional Analytic Methods for PDEs	16 MT
C4.6: Fixed Point Methods for Nonlinear PDEs	16 HT
C4.8: Complex Analysis: Conformal Maps and Geometry	16 MT
C4.9: Optimal Transport and Partial Differential Equations	16 MT
C5.2: Elasticity and Plasticity	16 MT
C5.4: Networks	16 MT
C5.5: Perturbation Methods	16 MT
C5.6: Applied Complex Variables	16 HT
C5.7: Topics in Fluid Mechanics	16 MT
C5.9: Mathematical Mechanical Biology	16 HT
C5.11: Mathematical Geoscience	16 MT
C5.12: Mathematical Physiology	16 MT
C6.1: Numerical Linear Algebra	16 MT
C6.2: Continuous Optimisation	16 HT
C6.3: Approximation of Functions	16 MT
C6.4: Finite Element Methods for PDEs	16 HT
C6.5: Theories of Deep Learning	16 MT
C7.1: Theoretical Physics	24MT/16HT
C7.4: Introduction to Quantum Information	16 HT
C7.5: General Relativity I	16 MT
C7.6: General Relativity II	16 HT
C7.7: Random Matrix Theory	16 HT
C8.1: Stochastic Differential Equations	16 MT
C8.2: Stochastic Analysis and PDEs	16 HT

C8.3: Combinatorics  
C8.4: Probabilistic Combinatorics (see page 13)

16 MT  
16 HT
